# Preface

The purpose of this book is to provide a comprehensive reference for the [ERAHUMED Decision Support System](#). Here you can find the technical descriptions of the algorithms employed by the system, as well as the user manual for the accompanying software.

The Support System and, hence, this book are currently under development on [Github](#). In particular, the `{erahumed}` R package is hosted [here](#).

For general information on the ERAHUMED project, please refer to the [official website](#). If you want to get in touch, you can contact any of us via e-mail:

- [Andreu Rico](#) (Coordinator)
- [Pablo Amador](#) (PhD Researcher)
- [Valerio Gherardi](#) (Software Developer)

# 1 Introduction

This is a book created from markdown and executable code.

See Martínez-Megías et al. (2024) for additional info.

## **Part I**

# **Technical description**

## 2 The ERAHUMED model: a bird's eye view

The ERAHUMED model for assessing the ecological status of the Albufera Natural Park consists of three key components:

- **Hydrology:** Water dynamics within the park
- **Exposure:** Estimating the exposure to toxic chemicals
- **Risk Assessment:** Evaluating the impact of exposure

From a spatial perspective, the natural park is divided into three types of water bodies: the Albufera lake, rice field clusters<sup>1</sup>, and irrigation ditches, which hydrologically connect the lake to the fields. Each of the model's computational layers incorporates specific quantitative models to simulate the relevant processes across all water bodies. This is summarized in Figure 2.1, where arrows indicate downstream dependencies and define the logical computation order.

Figure 2.1: Scheme of ERAHUMED model components. Directional arrows indicate the downstream dependencies of the various simulation layers.

To clarify this structure, we can summarize the role of each simulation layer in Figure 2.1 as follows:

---

<sup>1</sup>The exact definition of “clusters” is discussed in Section 4.2. For the purposes of this high-level description, we can think of them simply as groups of rice fields.

1. The system's hydrology, including water volumes and flows for all hydrological elements, is derived from minimal input data: daily water levels and sea outlet outflows for the Albufera lake. This is achieved through a set of simplifying assumptions about the hydrology of rice fields and irrigation ditches. Details on this model are provided in Chapter [4](#).
2. Exposure to chemicals is calculated by first simulating their application to rice fields based on typical cultivation patterns. The dispersion of chemicals is then modeled using a simplified set of differential equations designed to capture the key physical processes driving their spread. These calculations are described in detail Chapter [5](#).
3. The impact of chemicals is evaluated across all water bodies using a simplified approach based on Species Sensitivity Distributions, utilizing publicly available toxicity data for their estimation. This is described in detail in Chapter [6](#).

### 3 Model inputs

This chapter will collect all model inputs (numeric parameters, as well as more complex information such as time-series or data-frames). The description should be generally succinct and parameters should be collected in a table - leveraging on `erahumed::erahumed_docs()` to retrieve parameters documentation).

The goal here is not to explain in detail what every parameter represents, which will be clarified when explaining the algorithms. Rather, the goal is to have a central reference for all users inputs.

The table could contain links to the sections describing the specific algorithms for which the parameters being described play a role.

name	type	description
outflows_df	data.frame	Time-series dataset that provides the observational hydrological
weather_df	data.frame	A dataset that provides the relevant metereological time series,
variety_prop	numeric(3)	Vector of '3' positive values. Controls the proportions of field su
seed	numeric(1)	Seed for random number generation used by the simulation algo
storage_curve_slope_m2	numeric(1)	Slope of the (linear) storage curve of the Albufera Lake, in squa
storage_curve_intercept_m3	numeric(1)	Intercept of the (linear) storage curve of the Albufera Lake, in c
petp_surface_m2	numeric(1)	The value (in squared meters) of the surface that converts preci
management_df	data.frame	Dataset that provides the yearly schedule for irrigation and drai
ideal_flow_rate_cm	numeric(1)	Ideal inflow/outflow of a cluster, for days in which the cluster is
height_thresh_cm	numeric(1)	A positive number. Height threshold for water levels, below whi
ditch_level_m	numeric(1)	Constant water depth in ditches.
ca_schedules_df	data.frame	A dataset that provides the list of scheduled chemical applicatio
drift	numeric(1)	A number between '0' and '1'. Percentage of chemical applicatio
covmax	numeric(1)	A number between '0' and '1'. Interception potential of foliage a
jgrow	numeric(1)	A positive integer. Length (in days) of crop maturation cycle.
SNK	numeric(1)	A number between '0' and '1'. (TODO).
dact_m	numeric(1)	A positive number. Active sediment layer depth, expressed in m
css_ppm	numeric(1)	A positive number. Suspended sediment concentration, expresse
foc	numeric(1)	A number between '0' and '1'. Fraction of organic content.
bd_g_cm3	numeric(1)	A positive number. Bulk density of the sediment, expressed in g
qseep_m_day	numeric(1)	A positive number. Seepage rate, expressed in meters per day.
wilting	numeric(1)	A number between '0' and '1'. Wilting point.
fc	numeric(1)	A number between '0' and '1'. Field capacity.

## **4 Hydrological model of the Albufera Natural Park**

### **4.1 Overview**

### **4.2 Scheme of the hydrological model**

The content of this sections should be roughly the same as the corresponding [package vignette](#).

### **4.3 Water balance calculations**

#### **4.3.1 Albufera Lake**

#### **4.3.2 Rice field clusters**

#### **4.3.3 Irrigation ditches**

# **5 Exposure**

## **5.1 Overview**

## **5.2 Pesticide applications**

This should describe how chemical applications are simulated.

## **5.3 Pesticide dispersion**

### **5.3.1 Diagram of physical processes**

Roughly the content of this [vignette](#).

### **5.3.2 Evolution Equations**

### **5.3.3 Semi-numerical approach**

## **6 Risk assessment**

### **6.1 Overview**

### **6.2 Calculation of risk using SSDs**

# **Part II**

# **User Manual**

## 7 The ERAHUMED DSS User Interface

This chapter should explain how to run ERAHUMED simulations using the Shiny app. It may contain screenshots taken from the app to exemplify the various points.

### 7.0.1 How to run the DSS?

Describe various options available (which at the moment of writing may as well be “download the package” only - and perhaps a basic deployment on shinyapps.io).

### 7.0.2 The “Output” tab

### 7.0.3 The “Input” tab

## 8 The `{erahumed}` R package

This should not be an exhaustive description of the R package, but rather mention its existence and giving basic instructions for its installation and refer to the package vignette's and documentation for more details.
